

ABSTRACT

The present invention provides users with access to Internet-accessible databases via one portal of entry, such that queries need not be repeated multiple times in order to obtain needed information. Advantageously, the present invention will harness a systematic dynamic query profiler, document scoring, and display of retrieved documents via a knowledge-based system that facilitates user editing. Thus, the present invention will aid users so that less of their time and effort are required in order to obtain precisely the desired information for which they are searching.
